

How to Launch and Land a DJI Mini 2 Safely (Beginner Guide)

Steps

Step 1: Stand in an open area and confirm you have at least 10 ft × 10 ft (3 m × 3 m) of clear space around the drone.

Step 2: Place the DJI Mini 2 on flat ground with the camera facing away from you.

Step 3: Turn on the remote controller and wait until it finishes booting.

Step 4: Turn on the drone and wait until the startup lights finish.

Step 5: Connect your phone to the controller cable and open the DJI Fly app.

Step 6: Check the DJI Fly status bar and confirm the battery level and GPS status are safe for flight.

Step 7: Tap Auto Takeoff in DJI Fly and press and hold to confirm takeoff.

Step 8: Hover at 6–10 ft (2–3 m) for 5 seconds to confirm the drone is stable.

Step 9: Push the right stick forward for 3 seconds, then release it to hover.

Step 10: Push the right stick backward for 3 seconds to return to the takeoff spot.

Step 11: Tap Auto Land in DJI Fly and press and hold to confirm landing.

Step 12: After touchdown, stop the motors and power off the drone and the controller.

How to Launch and Land a Drone Safely (Beginner Guide)

Before you begin your first flight, ensure you have all the necessary equipment ready:

What You Need

- A fully charged drone battery
- A fully charged controller
- A smartphone (if your drone uses an app-based interface)
- Access to an open outdoor area with flat ground and no crowds

Safety is the most critical aspect of drone operation. Follow these essential guidelines:

Safety Notes Before You Start

- Pick a wide, open area away from people, cars, power lines, and trees.
- Do not fly in strong wind or rain conditions.
- Keep the drone in your line of sight at all times during flight.
- Check local regulations and airspace restrictions before flying.
- Ensure you have permission to fly in your chosen location.

Figure 1: Figure 1: Open, flat takeoff area with the drone placed on the ground. Choose a location similar to this with clear space in all directions.

Step-by-Step Launch and Landing Procedure

Pre-Flight Preparation

1. **Check the area** and make sure you have a clear takeoff space approximately the size of a small room with nothing above you (no branches, wires, or overhanging structures).
2. **Place the drone on flat ground** with the front of the drone facing away from you. The drone should be on a stable, level surface free from debris.
3. **Turn on the controller** and wait until it fully boots up. You should see indicator lights confirming the controller is ready.
4. **Turn on the drone** and wait until you see the normal startup lights and the aircraft is sitting still. Most drones will emit beeping sounds or display light patterns during initialization.
5. **Connect your phone to the controller** (if required by your drone model) and open the drone control app.

Step-by-Step Launch and Landing Procedure

Pre-Flight Preparation

1. Check the area and make sure you have a clear takeoff space approximately the size of a small room with nothing above you (no branches, wires, or overhanging structures).
2. Place the drone on flat ground with the front of the drone facing away from you. The drone should be on a stable, level surface free from debris.
3. Turn on the controller and wait until it fully boots up. You should see indicator lights confirming the controller is ready.
4. Turn on the drone and wait until you see the normal startup lights and the aircraft is sitting still. Most drones will emit beeping sounds or display light patterns during initialization.
5. Connect your phone to the controller (if required by your drone model) and open the drone control app.

6. 6. Confirm GPS and battery status in the app. Ensure the display shows adequate battery level and that the system indicates it is ready to fly. Wait for GPS lock if your drone has this feature—this typically takes 30–60 seconds.

Figure 2: Figure 2: Drone app screen showing battery level and "Ready to Fly" status. Verify all systems show green or normal status before takeoff.

Takeoff Procedure

7. **Start the motors** using the app's takeoff button or the controller's motor start command. Different drone models use different methods—consult your manual for the specific

Figure 2. Drone app screen showing battery level and "Ready to Fly" status. (Source: included in original draft PDF.)

Takeoff Procedure

- Start the motors using the app's takeoff button or the controller's motor start command.
- Slowly lift off and hover about 6–10 feet (2–3 meters) above the ground for a few seconds to confirm the drone is stable and responding properly to controls.

Initial Flight Practice

- Fly slowly in a straight line and practice small movements (forward, backward, left, right) while staying low. Keep movements gentle and deliberate.
- Return the drone to your takeoff spot and hover again at 6–10 feet.

Landing Procedure

- Land slowly by lowering the drone straight down until it touches the ground.
- Stop the motors after landing using the app or controller stop command. Wait until the propellers have completely stopped before approaching the drone.
